## Abstract

Notes of book [AS10], and another book [GR96] for information about path integral.

## Contents

<b>1</b>	<b>Todo</b>	<b>1</b>
<b>2</b>	<b>pp.33 eq.1.43</b>	<b>2</b>
<b>3</b>	<b>Eq. 3.5</b>	<b>4</b>
<b>4</b>	<b>Eq 9.4</b>	<b>5</b>
<b>5</b>	<b>License</b>	<b>5</b>

## 1 Todo

1. Understand in what case can the Gaussian integral formula can be applied. In another word, understand the analytical continuation of the Gaussian integral. See for example, buttom of pp.343 of [GR96].
2. Understand the Wick Rotation, cf. pp.356(ch11.5) of [GR96]. This is related to todo 1
3. Understand how the constant term in the path integral of a Feynman Kernal will(or will not) affect the physics. Understand the mathematical rationale to support this. (cf. buttom of pp.344 of [GR96].
4. I have doubt about the correctness of pp.110 eq 3.28 till pp.111 (Construction recipe of the path integral), especially about his argument, the size of the *Planck cell*.

Bonus objectives:

1. Find about the similarity between Path Integral of a free particle and the solution to a classical diffusion equation (cf. pp.112, footnote 1 of [AS10]).
2. Those marked *todo* in [AS10].

todo:analytical-c

## 2 pp.33 eq.1.43

In page 33 of [AS10], the author derives a difference of action, when we have a symmetry transformation paraterized by  $\omega_a$ :

$$x_\mu \rightarrow x'_\mu = x_\mu + \frac{\partial x_\mu}{\omega_a} \Big|_{\omega=0} \omega_a(x) \quad (2.0.1)$$

$$\phi^i(x) \rightarrow \phi^i(x') = \phi^i(x) + \omega_a(x) F_a^i[\phi] \quad (2.0.2)$$

We have:

$$\mathcal{L} = \mathcal{L}(\phi^i(x), \partial_{x_\mu} \phi^i(x)) \quad (2.0.3)$$

$$\mathcal{L}' = \mathcal{L}'(\phi'^i(x'), \partial_{x'_\mu} \phi'^i(x')) \quad (2.0.4)$$

$$= \mathcal{L} \left( \phi^i + F_a^i \omega_a, (\delta_{\mu\nu} - \partial_{x_\mu} (\omega_a \partial_{\omega_a} x_\mu)) \partial_{x_\nu} (\phi^i + F_a^i \omega_a) \right) \quad (2.0.5)$$

And

$$\Delta S = \int d^m x' \mathcal{L}' - \int d^m x \mathcal{L} \quad (2.0.6)$$

eq:dS-integrand

$$\begin{aligned} &= \int d^m x (1 + \partial_{x_\mu} (\omega_a \partial_{\omega_a} x_\mu)) \\ &\times \mathcal{L} \left( \phi^i + F_a^i \omega_a, (\delta_{\mu\nu} - \partial_{x_\mu} (\omega_a \partial_{\omega_a} x_\mu)) \partial_{x_\nu} (\phi^i + F_a^i \omega_a) \right) \\ &- \int d^m x \mathcal{L}(\phi^i(x), \partial_{x_\mu} \phi^i(x)) \end{aligned} \quad (2.0.7)$$

Then he argues that, "for constant parameters  $\omega_a$  the action difference  $\Delta a$  vanishes". Therefore "the leading contribution to the action difference of a symmetry transformation must be linear in the derivative  $\partial_{x_\mu} \omega_a$ ".

Then he writes that "A straightforward expansion of the formula above for  $\Delta S$  shows that these terms are given by"

$$\Delta S = - \int d^m x j_\mu^a(x) \partial_{x_\mu} \omega_a \quad (2.0.8)$$

where  $j_\mu^a$  is:

$$j_\mu^a = \left( \frac{\partial \mathcal{L}}{\partial (\partial_{x_\mu} \phi^i)} \partial_{x_\nu} \phi^i - \mathcal{L} \delta_{\mu\nu} \right) \frac{\partial x_\nu}{\partial \omega_a} - \frac{\partial \mathcal{L}}{\partial (\partial_{x_\mu} \phi^i)} F_a^i \quad (2.0.9)$$

I am particaly confused about how to do the "straightforward expansion". I guess I should do  $\frac{\partial}{\partial (\partial_{x_\mu} \omega_a)}$  to the integrand inside expression for  $\Delta S$ , though I don't really understand the reason. Even so, the integrand contains terms like  $\partial_{x_\mu} \partial_{\omega_a} x_\mu$ , which I don't know how to deal with.

**Solution.** The reality is a bit more complicated. We first do a first order expasion to get the infinitesimal difference:

$$\mathcal{L}' - \mathcal{L} \quad (2.0.10)$$

$$\begin{aligned} &\approx \frac{\partial \mathcal{L}}{\partial \phi^i} F_a^i \omega_a + \frac{\partial \mathcal{L}}{\partial (\partial_{x_\mu} \phi^i)} \left[ \partial_\mu (F_a^i \omega_a) - \partial_\mu \left( \omega_a \frac{\partial x_\nu}{\partial \omega_a} \right) \partial_\nu (\phi^i + F_a^i \omega_a) \right] \\ &= \omega_a \left[ \frac{\partial \mathcal{L}}{\partial \phi^i} F_a^i + \frac{\partial \mathcal{L}}{\partial (\partial_{x_\mu} \phi^i)} \left( \partial_\mu F_a^i - \partial_\mu \left( \frac{\partial x_\nu}{\partial \omega_a} \right) \partial_\nu (\phi^i + F_a^i \omega_a) \right) \right] \end{aligned} \quad (2.0.11) \quad \text{eq:l-l-omega}$$

$$+ \partial_\mu \omega_a \left[ \frac{\partial \mathcal{L}}{\partial (\partial_{x_\mu} \phi^i)} \left( F_a^i - \frac{\partial x_\nu}{\partial \omega_a} \partial_\nu (\phi^i + F_a^i \omega_a) \right) \right] \quad (2.0.12) \quad \text{eq:l-l-pmu-omega}$$

We also discover the integrand in Eq.2.0.6 to be

$$\left( 1 + \partial_\mu \left( \omega_a \frac{\partial x_\mu}{\partial \omega_a} \right) \right) \mathcal{L}' - \mathcal{L} \quad (2.0.13)$$

$$= \left( 1 + \partial_\mu \left( \omega_a \frac{\partial x_\mu}{\partial \omega_a} \right) \right) (\mathcal{L}' - \mathcal{L}) + \left( \partial_\mu \left( \omega_a \frac{\partial x_\mu}{\partial \omega_a} \right) \right) \mathcal{L} \quad (2.0.14) \quad \text{eq:integrand-l-density}$$

For the first term  $\left( 1 + \partial_\mu \left( \omega_a \frac{\partial x_\mu}{\partial \omega_a} \right) \right) (\mathcal{L}' - \mathcal{L})$ , the  $(\mathcal{L}' - \mathcal{L})$  already has terms of first order of  $\omega_a$  and of first order of  $\partial_\nu \omega_a$ . For our purpose, the second order terms  $(\partial_\nu (F_a^i \omega_a))$  from item 2.0.11 and item 2.0.12 can be ignored. Also, the item  $(\partial_\mu \left( \omega_a \frac{\partial x_\mu}{\partial \omega_a} \right)) (\mathcal{L}' - \mathcal{L})$  in eq.2.0.14 can also be ignored.

Therefore the integrand in Eq.2.0.6 becomes

$$(\mathcal{L}' - \mathcal{L}) + \left( \partial_\mu \left( \omega_a \frac{\partial x_\mu}{\partial \omega_a} \right) \right) \mathcal{L} \quad (2.0.15)$$

$$= \omega_a \left[ \frac{\partial \mathcal{L}}{\partial \phi^i} F_a^i + \frac{\partial \mathcal{L}}{\partial (\partial_{x_\mu} \phi^i)} \left( \partial_\mu F_a^i - \left( \partial_\mu \frac{\partial x_\nu}{\partial \omega_a} \right) \partial_\nu (\phi^i + F_a^i \omega_a) \right) \right] + \left( \partial_\nu \frac{\partial x_\mu}{\partial \omega_a} \right) \mathcal{L} \quad (2.0.16)$$

$$+ \partial_\mu \omega_a \left[ \frac{\partial \mathcal{L}}{\partial (\partial_{x_\mu} \phi^i)} \left( F_a^i - \frac{\partial x_\nu}{\partial \omega_a} \partial_\nu (\phi^i + F_a^i \omega_a) \right) + \frac{\partial x_\mu}{\partial \omega_a} \mathcal{L} \right] \quad (2.0.17)$$

Therefore, the term we seek, i.e. the coefficient of  $\partial_\mu \omega_a$  is

$$\frac{\partial \mathcal{L}}{\partial (\partial_{x_\mu} \phi^i)} \left( F_a^i - \frac{\partial x_\nu}{\partial \omega_a} \partial_\nu (\phi^i + F_a^i \omega_a) \right) + \frac{\partial x_\mu}{\partial \omega_a} \mathcal{L} \quad (2.0.18)$$

$$= \left( \mathcal{L} \delta_{\mu\nu} - \frac{\partial \mathcal{L}}{\partial (\partial_{x_\mu} \phi^i)} \partial_\nu \phi^i \right) \frac{\partial x_\nu}{\partial \omega_a} + \frac{\partial \mathcal{L}}{\partial (\partial_{x_\mu} \phi^i)} F_a^i \quad (2.0.19)$$

which is what we expect in equation 1.43 of [AS10].

**Question:** as for why we should ignore the term with  $\omega_a$ , there are two posts ( [1], [2] ) might be useful for a thought.

confusion

I had great doubt about this problem. Though I have posted an answer on [1], I don't think that answer is satisfactory.

### 3 Eq. 3.5

It is not so obvious to get Eq.3.5 in pp.99 of [AS10]. Here is my notes.

According to the book, Eq.3.3 is turned into (I set  $\hbar = 1$  occasionally, though sometimes I forgot that I have set  $\hbar = 1$ , orz):

$$\begin{aligned} \langle q_f | \int dq_N dp_N | q_N \rangle \langle q_N | p_N \rangle \langle p_N | e^{-i\hat{T}\Delta t} e^{-i\hat{V}\Delta t} \times \\ \int dq_{N-1} dp_{N-1} | q_{N-1} \rangle \langle q_{N-1} | p_{N-1} \rangle \langle p_{N-1} | e^{-i\hat{T}\Delta t} e^{-i\hat{V}\Delta t} \times \dots \\ \int dq_1 dp_1 | q_1 \rangle \langle q_1 | p_1 \rangle \langle p_1 | e^{-i\hat{T}\Delta t} e^{-i\hat{V}\Delta t} | q_i \rangle \end{aligned} \quad (3.0.20)$$

Notice that

$$\langle q | p \rangle = \frac{\exp(iqp/\hbar)}{\sqrt{2\pi\hbar}} \quad (3.0.21)$$

$$\langle p_N | e^{-i\hat{T}\Delta t} = \langle p_N | e^{-iT(p_N)\Delta t} \quad (3.0.22)$$

$$e^{-i\hat{V}\Delta t} | q_{N-1} \rangle = e^{-iV(q_{N-1})\Delta t} | q_{N-1} \rangle \quad (3.0.23)$$

$$(3.0.24)$$

T has only  
p, V has  
only q

Also,

$$\begin{aligned} \langle q_N | p_N \rangle \langle p_N | e^{-i\hat{T}\Delta t} e^{-i\hat{V}\Delta t} | q_{N-1} \rangle &= \frac{e^{iq_N p_N / \hbar}}{\sqrt{2\pi\hbar}} \langle p_N | e^{-iT(p_N)\Delta t} e^{-iV(q_{N-1})\Delta t} | q_{N-1} \rangle \\ &= \frac{e^{iq_N p_N / \hbar}}{\sqrt{2\pi\hbar}} \langle p_N | q_{N-1} \rangle e^{-iT(p_N)\Delta t} e^{-iV(q_{N-1})\Delta t} = \frac{e^{ip_N(q_N - q_{N-1})/\hbar}}{2\pi\hbar} e^{-i[T(p_N) + V(q_{N-1})]\Delta t} \end{aligned} \quad (3.0.25)$$

etc. Now we have to pay special attention to the start and end. For the start, we have a

$$\int dq_N \langle q_f | q_N \rangle = \int dq_N \delta(q_N - q_f)$$

So every  $q_N$  is replaced by  $q_f$ . For the end, we have

$$\langle q_1 | p_1 \rangle \langle p_1 | e^{-i\hat{T}\Delta t} e^{-i\hat{V}\Delta t} | q_i \rangle = e^{-i[T(p_1) + V(q_i)]} \frac{e^{ip_1(q_1 - q_i)}}{2\pi\hbar}$$

Together we have the whole thing into:

$$\begin{aligned} \int dq_1 \dots dq_{N-1} dp_1 dp_N \frac{1}{(2\pi\hbar)^N} \times \\ e^{i[p_1(q_1 - q_i) + \dots + p_N(q_N - q_{N-1})]} \times \\ e^{-i[T(p_1) + \dots + T(p_N) + V(q_i) + V(q_1) + \dots + V(q_{N-1})]} \end{aligned} \quad (3.0.26)$$

which is exactly eq.(3.5) in book.

## 4 Eq 9.4

The Hamiltonian for particle on a ring is claimed to be (Eq. 9.1 of [AS10], pp. 498):

$$H = \frac{1}{2}(-i\partial_\phi - A)^2 = \frac{1}{2}(p - A)^2 \quad (4.0.27)$$

The book [AS10] claims that

$$L = \frac{1}{2}\dot{\phi}^2 - iA\dot{\phi} \quad (4.0.28)$$

I am quite confused, especially about the appearance of  $\dot{\phi}$ . Can any explain a bit?

How I tried: Since the inverse of a Legendre transformation is Legendre transformation itself,

$$\text{Denote } x \equiv \frac{\partial H}{\partial p} = p - A, \text{ so,} \quad (4.0.29)$$

$$p = x + A, \quad H = \frac{1}{2}x^2, \text{ so,} \quad (4.0.30)$$

$$L = xp - H = x(x + A) - \frac{1}{2}x^2 = \frac{1}{2}x^2 + xA \quad (4.0.31)$$

So my calculation found that the Lagrangian of above Hamiltonian is:

$$L = \frac{1}{2}x^2 + xA \quad (4.0.32)$$

where

$$x = \frac{\partial H}{\partial p} \quad (4.0.33)$$
